Summary. Description of Zariquieya troglodytes ssp. espanoli nov., a new subspecies from the genus Zariquieya Jeannel, 1924, belonging to the subtribe Molopini, is described from a subterranean cavity in the Girona province, northeast Spain.

Keywords. Zariquieya troglodytes ssp. espanoli nov., Carabidae, Molopina, Iberian Peninsula.

Introduction
The genus Zariquieya Jeannel, 1924, was originally described as a subgenus of genus Molops Bonelli, in order to include Zariquieya troglodytes Jeannel, an interesting cave-dwelling Pterostichini Molopini. In 1946, Español published a brief summary of the species and its subterranean habitats, upgrading the subgenus proposed by Jeannel to a genus. Recently, a second species has been described, Z. bourniortensis Faille et al., 2011, from a subterranean cavity in La Guardia d’Ares, in the province of Lleida. In the present study we describe one subspecies of the Zariquieya troglodytes Jeannel, discovered in the cave of La Mosquera, Beuda (Girona), Spain.
